There are many different prescription medications that can be used to treat gastroparesis with Domperidone being one of the most well-known and effective treatment. This is by no means a complete list of all the prescription drugs that are available for treating Gastroparesis. I have decided to just cover the top 10. I will add more to this list as well as giving a more in depth description of each medication. Here are some of the other prescription medications for gastroparesis:

1. Reglan (Metoclopramide) unlike Domperidone is available by prescription in the United States, Canada, Australia, and the UK. Metoclopramide is also one of the top 100 most prescribed medications in the United States. It is on the World Health Organization's List of Essential Medicines, which is a list of the most effective and safe medicines needed in a health system.
2. Erythromycin is known to help with stomach emptying and is available in the United States by prescription.
3. Viagra (Sildenafil) is not just being used as a sexual aide for men after studies showed that many people with Gastroparesis who took Viagra had increased stomach emptying. It works by increasing the blood flow through the body and to the stomach helping it to operate better with digestion and stomach emptying.
4. Remeron (Mirtazapine) is an antidepressant that is being used for the treatment of gastroparesis and is available by prescription in the United States. This medication has been scientifically proven to be effective in the treatment of gastroparesis that has been unresponsive to other conventional prescription medications. Due to the antiemetic and appetite stimulant properties make it a great medication with a low risk of side effects. This medication is also available in Sublingual form with an orange flavor and is absorbed quickly through the mouth and tongue which is great when you are too nauseated to swallow pills.
5. Phenergan (Promethazine) is an antiemetic prescription medication that helps to control nausea and to help you sleep.
6. Mitemcinal is an experimental drug that is in the phase 2 process and has shown some very promising results for treatment of many of the symptoms of gastroparesis. Currently there is no set time line for when this product will be available for consumers.
7. Renzapride is a gastroprokinetic agent and antiemetic that was approved for the treatment of gastroparesis in the UK and other countries but is not approved in the United States. As of April 2008, the drug manufacturer Alizyme ceased all development of renzapride, after a Phase III trial in the U.S. did not show enough efficacy over placebo to justify further development and FDA approval costs. Other studies have shown that Renzapride is very effective in Gastroparesis treatment. So, if you live in the United States you will have to order this medication from the UK.
8. Cisapride is a gastroprokinetic agent, a drug that increases motility in the upper gastrointestinal tract. It is not available in the United States however, it is in the UK, Canada, Australia, and many other countries. So, just like with Domperidone and Renzapride you will have to order it from one of these countries.
9. Prucalopride (Resolor) is a drug acting as a selective, high affinity 5-HT4 receptor agonist which targets the impaired motility associated with Gastroparesis chronic constipation, thus normalizing bowel movements. Prucalopride was approved for use in Europe in 2009, in Canada in 2011 and in Israel in 2014 but it has not been approved by the Food and Drug Administration for use in the United States. So, yet again you will have to order this medication from the countries that have it available.

10. Probiotics Lactobacillus rhamnosus and Bifidobacterium lactis have been shown in both animal and human tests to be effective at speeding up gastric emptying, increasing the motility of the intestines, and increasing the number of bowel movements which helps to keep many of the symptoms of gastroparesis from getting severe.
